

Figure 6: Lake Hugh Muntz Cyanobacteria (blue green algae) levels.

In summary, Lake Hugh Muntz is likely to periodically continue experiencing algae blooms as the above graphs illustrate water quality continues to remain at a relatively consistent level. The duration and level of these blooms are and will be difficult to predict, as there are many factors involved.

As detailed above any comparison to water quality objectives should be undertaken cautiously as Lake Hugh Muntz does not categorically fit the Queensland's Water type classification and the above analysis was provided as indication only.
